

67 09-C-01 Sludge clean-up plan

The plan is to collect sewage water from Taichung City for water treatment at recycling center, and properly remove sludge to reduce environmental pollution from sewage, and reduce the amount of waste.

The collected sewage is delivered to 5 recycling centers (Ishioka dam, Taichung specific area, Lishan, Fukuda, mountains). There is no industrial but domestic sewage input at Lishan and Wanshan plants since they are located in mountains. The small amount of sewage sludge without harmful ingredients can be utilized to plant. Ishioka dam plant is currently in the commissioning period so that there is no sludge output. The collected sewage in Taichung city is mostly delivered to Fukuda plant and specific area of Taichung Harbor. The amount of sludge in Fukuda plant is about 250 to 300 tons / month. The amount of sludge in specific area of Taichung Harbor is about 60 to 90 tons / month.
